WPI; 2001-257785/26.

Peptides comprising a portion of a protein selected from plasminogen, endostatin, VEGF, FLT-1 and KDR/FLK-1 are useful for treating primary tumor growth.

Claim 7; Page 18; 34pp; English.

The present invention relates to anti-angiogenesis peptides from a portion of a selected from plasminogen, endostatin, VEGF or FLT-1. The invention is used to prevent or treat primary tumour growth or metastasis or undesired angiogenesis

The invention discloses a peptide comprising a portion of a protein e.g. plasminogen, endostatin (Endo-1-4), vascular endothelial growth factor (VEGF), FLT-1 or kinase insert domain containing receptor/FLK-1. These peptides are able to act as potent angiogenic inhibitors (Angio-1-5) inhibiting endothelial cell proliferation and retarding tumour growth. Angiogenesis is the process of new blood vessel formation from precess of new blood vessel formation from precesses and including endothelial cell proliferation, migration and assembly into tubule structures. It plays an important role in normal physiological functions such as embryonic development and wound healing. Conditions including tumour growth and metastasis, rheumatoid arthritis and psoriasis. Anticancer therapy by inhibiting tumour angiogenesis is called antiangiogenic therapy. VEGF is a endothelial specific mitogen that functions through two high affinity tyrosine kinase receptors, FTT-1 and FLK-1 (not defined). Protein-protein interactions are crucial to many physiological and pharamacological processes and the peptides disclosed interactions. The peptides are useful for preventing or treating undesired angiogenesis and primary tumour growth or metastasis. The sequences presented in ABG97510-ABG97559 are examples of
                                                                                                                                                                                                                                                                                                                                                                          Novel peptide for preventing/treating undesired angiogenesis, has a portion of a protein e.g. plasminogen, endostatin, and potent antiangiogenic activity and endothelial cell proliferation inhibition
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Antiangiogenic; angiogenesis; cancer; endostatin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         100.0%; Score 68; DB 5; 1

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is a peptide which is effective in inhibiting undesirable angiogenesis. Angiogenesis is the process of new blood vessel formation from pre-existing vessels. Inappropriate angiogenesis is associated with various pathological conditions including solid tumour growth and metastasis. The present peptide can be used to to prevent tumour metastasis or inhibit the growth of a primary tumour
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Peptides having potent anti-angiogenic activity, useful for the treatment of tumors, comprise a portion of a FLT-1 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Angiogenesis; plasminogen; endostatin; Endo-; VEGF; vascular endothelial growth factor; FLT-1; kinase insert domain; FLK-1; angiogenic inhibitor; Angio-; endothelial cell; proliferation; tumour growth, blood vessel formation; migration; tubule structure; embryonic development; wound healing; tumour metastasis; rheumatoid arthritis; psoriasis; anticancer; therapy; anticance therapy; anticance therapy;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

Gene clone of inhibitory factor for hyperplasia of inner blood vessel cells in human body's real tumor, and its use in anti-tumor blood vessel
               of prematurity, macular degeneration, corneal graft rejection, retrolental fibroplasia, rubeosis, capillary proliferation in atherosclerotic plaques and osteoporosis. Other angiogenesis-dependent diseases include Osler-Webber syndrome, myocardial angiogenesis, plaque neovasculisation, telangiectasia, haemophiliac joints and wound granulation. In addition, the peptides can be used as birth control
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes a novel preparation which inhibits the proliferation of blood vessel endothelium and prevents the regeneration activity of tumour blood vessels. The preparation can also be used as a biological preparation in the treatment of tumours. This sequence represents the murine endostatin protein described in the invention
 retinopathy
                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

This sequence is the mouse endostatin. The invention relates to a the mutant endostatin (EM), which has anti-angiogenic activity, and is designated EM1. Compositions comprising EM1 or fusion proteins comprising EM1, are useful for treating diseases characterised by angiogenic activity, such as angiogenesis-dependent cancers, benign tumours, cactivity, such as angiogenesis, ocular angiogenesis, Osler-Webber Syndrome, myocardial angiogenesis, plaque neovascularisation, contestinal adhesions, atherosclerosis, scleroderma, hypertrophic scars, cat scratch disease, Helicobacter pylori ulcers, dialysis graft vascular access stenosis, contraception and obesity. In particular, the diseases treatable by EM1 comprise cancer, especially renal cancer. The methods creatable by EM1 comprise cancer, especially renal cancer. The methods provide a means for introducing EM1 into mammalian cells via gene therapy, for production of the EM1 via recombinant means, as well or better than whole endostatin. Use of EM1 protein. EM1 performs as well or better than whole endostatin. Use of EM1 is advantageous for treatment of angiogenic diseases in that increasingly smaller peptides are more potent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  angiogenic diseases in that increasingly smaller peptides are more potent
on a weight basis, and may be able to better penetrate tissues
                                                                                                                                                                                      benign tumour; rheumatoid arthritis; psoriasis; ocular angiogenesis; osler-Webber Syndrome; myocardial angiogenesis; angiofibroma; cancer; plaque neovascularisation; telangiectasia; atherosclerosis; scleroderma; dialysis graft vascular access stenosis; renal cancer; therapy.

This invention describes a novel viral gene therapy vector comprising a nucleic acid molecule encoding an anti-angiogenic polypeptide chosen from human or murine andiogenic polypeptide chosen from inhibiting fusions and fragments, where the viral vector is sufficiently attenuated for use in human gene therapy. The products of the invention have anti-angiogenic, cytostatic, anti-diabetic and ophthalmological activity. The vector is used in gene therapy for inhibiting tumour growth in humans harbouring a solid tumour. The vector expresses an anti-angiogenic polypeptide. An additional use comprises treatment of diabetic retinopathy, where the anti-angiogenic polypeptide inhibits angiogenesis in the vicinity of the retina. The vector is administered to cells ex vivo and then administered to the patient
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 a signal sequence, an immunoglobulin For region, an angiogenesis inhibitor selected from angiostatin, endostatin, a plasminogen fragment having angiostatin activity, a collagen XVIII fragment having endostatin activity, or combinations of them. The fusion protein (immunofusin) is used to inhibit angiogenesis and to treat diseases or conditions mediated by angiogenesis. Conditions that may be treated include solid tumours, blood born tumours metastasis, benign tumours including mediated baemangiomas, acoustic neuromas, neurofibromas, trachomas and pyrogenic reaminogathy, retinopathy of prematurity, macular degeneration, corneal graft rejection, neovascular glaucoma, retrolental collar plane, rubeosis and osler-Webber syndrome; myocardial angiogenesis, plaque neovascularisation, telangiectasia, haemophiliac joints' angiofibroma, wound granulation, and excessive or abnormal stimulation of hypertrophic scars, i.e. keloid scars. The DNA constructs may be used in the construction of immunofusin containing murine immunoglobulin Fc fragment
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                              rel fusion protein of angiostatin or endostatin and an immunoglobulin region, useful for treating conditions mediated by angiogenesis, such rheumatoid arthritis, tumors and macular degeneration.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Endostatin; antiangiogenic; angiogenesis; human; mouse; chicken; cancer; inflammation; angiogenesis-dependent disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The patent discloses a DNA molecule encoding a fusion protein comprising
              ocular angiogenic disease; diabetic retinopathy; macular degeneration; myocardial angiogenesis; plaque neovascularisation; telangiectasia; wound granulation; keloid scar; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

The present invention provides endostatin peptides which can be used in the modulation of angiogenesis. This is useful in the treatment of cancers, inflammation, rheumatoid arthritis, chronic articular rheumatism, psoriasis, disorders associated with inopportune invasion of prematurity, ascular degeneration, corneal graft rejection, retrolental fibroplasia, tubososis, capillary proliferation in atherosclerotic plaques and osteoporosis. Other angiogenesis-dependent diseases include osler-webber syndrome, myocardial angiogenesis, plaque neovasculisation, telangiectasia, haemophiliac joints and wound granulation. In addition, the peptides can be used as birth control

The present invention relates to anti-Vascular Endothelial Growth Factor (VEGF) antibodies that bind to the same epitope as the monoclonal antibody ATCC FPA 1595 and which significantly inhibit VEGF binding to the VEGF receptor VEGFRI, without inhibiting VEGF binding to the VEGF receptor VEGFRI. The present sequence is murine endostatin. Endostatin any be conjugated onto the anti-VEGF antibodies of the present invention. The anti-VEGF antibodies of the present invention are useful for the treatment and diagnosis of cancer, especially vascularised solid tumours
neovascularisation, choroidal neovascularisation, retinal neovascularisation, age-related macular degeneration, visual impairment, occular dysfunction, loss of vision, retinopathy, or blindness in a human. The present sequence is a protein shown in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Immunogenic composition for the treatment and diagnosis of cancer comprises an anti-VEGF (vascular endothelial growth factor) antibody binding the same epitope as the monoclonal antibody ATCC PTA 1595.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Murine; endostatin; cytostatic; antiproliferative; vascular endothelial growth factor; VEGF; antibody; VEGF2 receptor; cancer; vascularised solid tumour.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               100.0%; Score 68; DB 3; Length 191; 100.0%; Pred.                                                                     New peptide useful for the preparation of medicaments with antianglogenic activity that may be used in treating tumors or metastases, comprises a sequence corresponding to fragments of human endostatin.
                                                                                                                                                                                                                   sequences corresponding to the human endostarin polypeptide sequence, its salt or non-toxic derivative. The peptides are useful in the preparation of medicaments with antianglogenic activity which may be useful in treating tumours or metastages. This sequence represents a human endostatin polypeptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to an adeno-associated viral (AAV) vector comprising a polynucleotide that comprises a nucleic acid segment that encodes a choroidal or ocular neovascularisation inhibitory polypeptide operably linked to a promoter that expresses the segment to produce the polypeptide in a selected mammalian host cell. Such a vector is useful for providing a choroidal or coular neovascularisation inhibitory polypeptide to a mammal, for use in the therapy of ocular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel adeno-associated viral vector comprising polynucleotide encoding pigment epithelium-derived factor, useful for treating choroidal neovascularization, blindness, loss of vision.
                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                     The invention relates to peptide comprising 20-50 amino acids with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Vector, rAAV, recombinant adeno-associated viral vector, anti-angiogenesis, PEDF; angiogenesis, eye disorder, blindness, retinal degeneration, macular degeneration, neovascularisation,

```
The present invention relates to antibody-based compositions comprising an immunoconjugate such as anti-vascular endothelial growth factor (VEGF) antibody (Ab) (or its antigen-binding fragment), attached to a biological agent, where the Ab binds to the same epitope as the monoclonal antibody (MAD) 2C3 ATCC PTA 1595, and significantly inhibits VEGF binding to the VEGF receptor VEGFR2 (KDK/Flk-1) without inhibiting VEGF binding to the VEGF receptor VEGFR2 (KDK/Flk-1) without inhibiting vEGF binding to the VEGF receptor VEGFR2 (KDK/Flk-1). The compositions of the invention are useful in therapy, and diagnosis, for inhibiting angiogenesis in an inmial having ocular neovascular disease or macular degeneration, and for delivering a biological agent to a vascularised tumour. The compositions can also be used for treating cancer and subjects at risk of developing, a vascularised solid tumour, a metastatic tumour or metastases from a primary tumour. The composition is useful for specifically inhibiting to VEGF-induced endothalial cell proliferation, without significantly inhibiting to VEGF-induced endothalial cell proliferation, without significantly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          inhibiting VEGF-induced macrophage, osteoclast or chondroclast function. The compositions can be used for treating various diseases such as inflammatory disorders, atherosclerosis, diabetic retinopathy. restenosis, acquired immune deficiency syndrome (AIDS), blood borne tumours, corneal graft rejection, Crohn's disease, fungal ulcers, infections, sickle cell anaemia, and endomerriosis. The present sequence represents mouse endostatin. Endostatin may be attached or functionally associated with anti-VEGF antibodies

```
The invention relates to fusion protein comprising a nucleotide-binding domain (NBD), a ligand-binding domain (LBD) of an intracellular receptor (ICR) and a transcription regulating domain (TBD). NBD is a polydactyl cancer finds a protein (ZFP), or a modular part of it, that interacts specifically with a contiguous sequence of at least 3 nucleotides. The fusion protein functions as a ligand-activated transcriptional regulator. The fusion protein and the nucleic acid encoding it, are used to regulate gene expression, particularly in gene therapy for treating malignant cell proliferative diseases (e.g. psoriasis, proliferative diseases (e.g. psoriasis, penphigus vulgaris, Behcet's syndrame and lipid histocytosis). The fusion protein and its DNA are also useful for treating diseases caused by virues in humans/plants, genetic and/or acquired diseases. The fusion protein can be designed to target any selected gene (endogenous or exogenous), and can be made to have different selectivity or specificity for endogenous or exogenous is not expensed in the present sequence is murine for endogenous and the manner for expense to the present sequence is murine.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ô
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 endostatin fused to an N-terminal secretion signal. The corresponding CDNA sequence was used in the construction of Left end shuttle plasmids containing regulatable transgene cassettes for evaluation of Cys2-His2 Zinc finger DNA binding domain (DBD)-Oestrogen receptor (ER) LBD
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          EMBO J. 17:1656-1664 (1998).

-!- FUNCTION: Endostatin potently inhibits endothelial cell
proliferation and angiogenesis. May inhibit angiogenesis by
binding to the heparan sulfate proteoglycans involved in growth
factor signaling.

Hum. Mutat. 23:77-84(2004).

-!- FUNCTION: COLAIRA probably plays a major role in determining the retinal structure as well as in the closure of the neural tube.

-!- FUNCTION: Endostatin potently inhibits endothelial cell proliferation and angiogenesis. May inhibit angiogenesis by binding to the heparan sulfate proteoglycans involved in growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Zhi-Yong H., Biao L., Wei-Jie Z., Xiang-Fu W.; "Cloning and expression of human endostatin gene in Escherichia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Submitted (SEP-1999) to the EMBL/GenBank/DDBJ databases.

position 1437 and prostate cancer. Heterozygous Asn-1437 individuals have a 2.5 times increased chance of developing prostate cancer as compared with homosygous Asp-1437 individuals.

-!- DISEASE: Defects in COL18A1 are a cause of Knobloch syndrome (KNO) [MIN:26750]; an autosomal recessive disorder defined by the occurrence of high myopia, vitreoretinal degeneration with retinal detachment, macular abnormalities and occipital encephalocele.
-!- SIMILARITY: Belongs to the fibril-associated collagens with interrupted helices (FACIT) family.
-!- SIMILARITY: Contains 1 TSP N-terminal (TSPN) domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                  MIM, 267750, -.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A; Title: Endostatin: an endogenous inhibitor of angiogenesis and tumor growth.
A; Reference number: A58816; MUID:97160848; PMID:9008168
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          A. Molecule type: protein
A. Residues: 1591-1610 < ORBS
A. Residues: 1591-1610 < ORBS
A. Residues: 1591-1610 < ORBS
A. Experimental acurce: hemangioendothelium cells
A. Note: inhibits endothelial cell proliferation
C. Comment: Prolines and lysines at the third position of the tripeptide repeating unit (() tated and subsequently O-glycosylated.
C. Comment: The different splice forms of collagen alpha 1(XVIII) may be involved in perion of comment: Endostatin is released from collagen alpha 1(XVIII) chain by the action of unity be useful in treating solid tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     A/TOBSTICATELLES FORT 111179

MOTI protein - yeast (Saccharomyces cerevisiae)

Althernate names: protein LPR4c; protein YPL082c

C;Alternate names: protein LPR4c; protein YPL082c

C;Species: Saccharomyces cerevisiae

C;Date: 17-Apr-1993 #sequence_revision 17-Apr-1993 #text_change 09-Jul-2004

A) Title: Four small brosophila heat shock proteins are related to each other and to mamm A) Reference number: A03909; MUID: 82248004; PMID: 6285380
A) Accession: A02220
A) Molecule type: DNA
A) Residues: 1-209 < ING>
A) Note: the authors translated the codon GAC for residue 15 as Glu, CAG for residue 22 a A) Note: the codon usage table proposed by the authors and the translation of the protein C) Comment: This small heat shock protein is related to alpha crystallin.
C) Genetics:

Sequence 55246, Application US/09270767

Patent No. 6703491

GENERAL INFORMATION:

TILLE OF INVENTION: Nucleic acids and proteins of Drosophila melanogaster

FILLE REFERENCE: File Reference: 7326-094

CURRENT APPLICATION NUMBER: US/09/270, 767

CURRENT FILING DATE: 1999-03-17

NUMBER OF SEQ ID NOS: 62517

SOFTWARE: PatentIN Ver. 2.0

LENGTH: 151
                                                                                                                                                                                        US-09-270-767-40030

Sequence 13. Application US/09561005
GENERAL INFORMATION:
Patent NO. 6703020
GENERAL INFORMATION:
APPLICANT: Philip E. Thorpe
APPLICANT: Rolf A. Brekken
TITLE OF INVENTION: ANTHBODY CONJUGATE METHODS FOR SELECTIVELY INHIBITING VEGF
FILE REFERENCE: 4001.002585
CURRENT FAPLICATION NUMBER: US/09/561,005
CURRENT FILING DATE: 1999-04-28
NUMBER OF SEQ ID NOS: 44
SOFTWARE: PatentIn Ver. 2.0
SEQ ID NO 13
LENGTH: 191
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
Sequence 13. Application US/09998831

Fateant No. 6676941

GENERAL INFORMATION:

APPLICANT: Philip E. Thorpe

APPLICANT: Rolf A. Brekken

TITLE OF INVENTION: ANTIBODY CONJUGATE COMPOSITIONS FOR SELECTIVELY

TITLE OF INVENTION: INHIBITING VEGF

TITLE OF INVENTION: INHIBITING VEGF

TITLE OF INVENTION: ANTIBODY CONJUGATE COMPOSITIONS FOR SELECTIVELY
